

We've all heard the maxim that the only constant in the world is change.

That is certainly true in almost every aspect of life, and your upcoming board exam is no exception. Fortunately, the products from Prodigy Anesthesia are evolving to help you tackle the new questions and question types that will appear on your exam.

Did you know that in the past two years alone, the CCNA exam has added almost 100 new topics? Did you know that Huntington's Chorea was one of them? A curious fact though--no other diseases of the neuromuscular system were added. So, why this one?

Well, I have a theory, I believe that each specific topic was added as each new set of questions were added. Huntington's Chorea was added as a topic simply because a new question about it is sitting there in the CCNA exam databank ready to pop onto your computer screen when you least expect it.

One of the new topics added was arterial blood gas interpretation. That's pretty specific, so I thought I would develop a pretty specific solution for you. Everything you need to know to interpret a question on arterial blood gas interpretation is available in a FREE 15 page workbook found at www.prodigyanesthesia.com Just click the button labelled Free Stuff!

You may think that ABG interpretation is easy, and I would agree, but if you are unsure at all, check out the workbook. And if you're still wondering what you need to know about Huntington's Chorea, then stay tuned til next week!
